12.6. LABS

## **Exercise 12.1: Assign Pods Using Labels**

## Overview

While allowing the system to distribute Pods on your behalf is typically the best route, you may want to determine which nodes a Pod will use. For example you may have particular hardware requirements to meet for the workload. You may want to assign VIP Pods to new, faster hardware and everyone else to older hardware.

In this exercise we will use labels to schedule Pods to a particular node. Then we will explore taints to have more flexible deployment in a large environment.

1. Begin by getting a list of the nodes. They should be in the ready state and without added labels or taints.

student@cp:~\$ kubectl get nodes

NAME	STATUS ROLES
cp	Ready control-
orker	Ready <none></none>

2. View the current labels and taints for the nodes.

student@cp:~\$ kubectl describe nodes |grep -A5 -i label

```
Labels:

beta.kubernetes.io/arch=amd64

beta.kubernetes.io/os=linux

kubernetes.io/hostname=scp

kubernetes.io/os=linux

node-role.kubernetes.io/control-plane=

--

Labels:

beta.kubernetes.io/arch=amd64

beta.kubernetes.io/arch=amd64

kubernetes.io/arch=amd64

kubernetes.io/arch=amd64

kubernetes.io/os=linux

kubernetes.io/os=linux

system=secondOne
```

student@cp:~\$ kubectl describe nodes |grep -i taint

```
Taints: <none>
Taints: <none>
```

3. Get a count of how many containers are running on both the cp and worker nodes. There are about 24 containers running on the cp in the following example, and eight running on the worker. There are status lines which increase the **wc** count. You may have more or less, depending on previous labs and cleaning up of resources. Take note of the number of containers, and then notice the numbers change due to scheduling. The change between nodes is the important information, not the particular number. If you are using **cri-o** you can view containers using **crictl ps**.

student@cp:~\$ kubectl get deployments --all-namespaces

NAMESPACE	NAME	READY	UP-TO-DATE	AVAILABLE	AGE
accounting	nginx-one	1/1	1	1	19h

```
default
             anotherweb-apache
                                                                        8h
                                       1/1
default
             web-one
                                               1
                                                            1
                                                                        45m
default
             web-two
                                       1/1
                                               1
                                                            1
                                                                        45m
                                       1/1
                                                                        35h
kube-system cilium-operator
<output_omitted>
```

student@cp:~\$ sudo crictl ps | wc -l

```
24
```

student@worker:~\$ sudo crictl ps | wc -l

```
21
```

4. For the purpose of the exercise we will assign the cp node to be VIP hardware and the secondary node to be for others.

```
student@cp:~$ kubectl label nodes cp status=vip
```

```
node/cp labeled
```

student@cp:~\$ kubectl label nodes worker status=other

```
node/worker labeled
```

5. Verify your settings. You will also find there are some built in labels such as hostname, os and architecture type. The output below appears on multiple lines for readability.

```
student@cp:~$ kubectl get nodes --show-labels
```

```
STATUS ROLES
                                    AGE
                                         VERSION
                                                   LABELS
NAME
        Ready
                 control-plane
                                   35h v1.33.1
                                                   beta.kubernetes.io/arch=amd64,
ср
beta.kubernetes.io/os=linux,kubernetes.io/arch=amd64,kubernetes.io/hostname=cp,
kubernetes.io/os=linux,node-role.kubernetes.io/control-plane=,node-role.kubernetes.io/master=,
node.kubernetes.io/exclude-from-external-load-balancers=,status=vip
worker Ready <none>
                                  35h v1.33.1 beta.kubernetes.io/arch=amd64,
beta.kubernetes.io/os=linux,kubernetes.io/arch=amd64,kubernetes.io/hostname=worker,
kubernetes.io/os=linux,status=other,system=secondOne
```

6. Create vip.yaml to spawn four busybox containers which sleep the whole time. Include the nodeSelector entry.

```
{\tt student@cp:``$ cp /home/student/LFS258/SOLUTIONS/s\_12/vip.yaml .}
```

```
student@cp:~$ vim vip.yaml
```

## vip.yaml

```
apiVersion: v1
kind: Pod
metadata:
name: vip
spec:
```

12.6. LABS 3

```
containers:
     - name: vip1
       image: busybox
       args:
       - sleep
10
       - "1000000"
11
     - name: vip2
12
      image: busybox
13
       args:
14
15
       - sleep
       - "1000000"
16
     - name: vip3
17
       image: busybox
18
       args:
19
       - sleep
20
       - "1000000"
21
     - name: vip4
22
       image: busybox
23
24
       args:
25
       - sleep
       - "1000000"
26
27
     nodeSelector:
28
       status: vip
```

7. Deploy the new pod. Verify the containers have been created on the cp node. It may take a few seconds for all the containers to spawn. Check both the cp and the secondary nodes. From this point forward use **crictl** where the step lists **docker** if you have deployed your cluster with cri-o.

```
student@cp:~$ kubectl create -f vip.yaml

pod/vip created

student@cp:~$ sudo crictl ps |wc -l

28

student@worker:~$ sudo crictl ps |wc -l

21
```

8. Delete the pod then edit the file, commenting out the nodeSelector lines. It may take a while for the containers to fully terminate.

```
student@cp:~$ kubectl delete pod vip

pod "vip" deleted

student@cp:~$ vim vip.yaml

....
# nodeSelector:
# status: vip
```

9. Create the pod again. Containers can now be spawning on either of the node. You may see pods for the daemonsets as well.

10. Determine where the new containers have been deployed. They should be more evenly spread this time. Again, the numbers may be different, the change in numbers is what we are looking for. Due to lack of nodeSelector they could go to either node.

```
student@cp:~$ sudo crictl ps |wc -1

24

student@worker:~$ sudo crictl ps |wc -1

25
```

11. Create another file for other users. Change the names from vip to others, and uncomment the nodeSelector lines.

```
student@cp:~$ cp vip.yaml other.yaml
student@cp:~$ sed -i s/vip/other/g other.yaml
student@cp:~$ vim other.yaml
```

12. Create the other containers. Determine where they deploy.

```
student@cp:~$ kubectl create -f other.yaml

pod/other created

student@cp:~$ sudo crictl ps |wc -l

24

student@worker:~$ sudo crictl ps |wc -l

25
```

12.6. LABS 5

13. Shut down both pods and verify they terminated. Only our previous pods should be found.

```
student@cp:~$ kubectl delete pods vip other
```

```
pod "vip" deleted
pod "other" deleted
```

student@cp:~\$ kubectl get pods

<output\_omitted>
